Re: Analysis of samples identified as "**Georgetown Park Lake**" water samples; samples dated & received – 08/17/20 analysis requested –E. Coli Bacteria.

| <u>PARAMETER</u> | <u>RESULT</u> |
|---|---------------|
| # 1 sample- E. Coli Bacteria, CFU/100ml | 40.0 |
| #2 sample- E. Coli Bacteria, CFU/100ml | 12.0 |
| #3 sample- E. Coli Bacteria, CFU/100ml | 92.0 |

Analyses are in accordance with Standard Methods for the Examination of Water and Wastewater, 10th ed.

E.Coli values at the surface were a bit high. The highest observed value of bacteria is 92.0 CFU/100ml. Full body contact recreation (including swimming) counts of E. coli should not exceed 130 (CFU/100mL) as a monthly geometric mean of at least five samples per the State of Michigan standard, or single samples should not exceed 298 (CFU/100) (235 CFU/100mL in a designated bathing beach area) per Federal (EPA) guidelines.

*Current recreational water quality standards do not rely on Total Coliform counts.
